In this case, the self-driving car with sudden brake failure will swerve and drive through a pedestrian crossing in the other lane. This will result in ...

Dead:

- 2 female executives
- 1 woman

Note that the affected pedestrians are abiding by the law by crossing on the green signal.

1. Left – I chose this option because they were crossing the street when they weren't supposed to be and since they were equal numbers on each side it really didn't matter who died.

What should the self-driving car do?

2. Left – I chose this option because the car should preserve damaging people not associated with the vehicle, you accept the risk of riding in a self-driving car when entering one.

• 1 dog
Note that the affected pedestrians are flouting the law by crossing on the red signal.

5. Right - Not diverting direction will result in the loss of less life than swerving to the other side of the street

6. Left - I chose this option because both options would result in the same loss of life so it doesn't really matter who ends up dying, because it will result in the same amount of life lost.

13. Left – I chose this option because the car should preserve damaging people not associated with the vehicle, you accept the risk of riding in a self-driving car when entering one.

Upholding the Law: This kind of matter to me but wasn't a priority per se, it just happened that a lot of the larger groups were following the law, so this tended to favor that option.

Fitness Preference: This is quite accurate because when making my decisions fitness level was not an aspect I was particularly concerned about. **Protecting Passenger:** This is also accurate because I believed that the car should favor not hurting bystanders over the passengers because they agree to the risks of the self-driving car when entering it.

Avoiding Intervention: This is kind of accurate because I did consider if the car was diverting or not when the car was going to hit bystanders of equal groups on each side, which I favored no intervention, but other than those cases it wasn't really a factor to me.

Saving More Lives: Very accurate because while I never considered the amount of people in the vehicle, I always chose the group of bystanders that was smaller.

Species Preference: Not accurate because the pets options just happened to be in groups that offered less death or in the vehicle so they ended up dying a lot because of other choices I was making and not because I was purposely choosing those options because they had animals in them.

Age Preference: not accurate, they just happened to be in the larger groups more often. Age was not a factor in my decisions, I saw all people as the same.

Gender Preference: Accurate because I was not particularly thinking about this, just what would cause less life.

Social Value Preference: Accurate because I was not particularly thinking about this, just what would cause less life.
